

Noah Lee

Full-Stack Software Engineer · Secure Cloud-Native Systems on AWS

Chicago, IL · github.com/chzylee · endotlee.com

Seven years building and securing cloud-native systems on AWS, with a track record of migrating legacy systems, owning systems at scale, and leading and mentoring engineers alongside individual contributor work. Now independent, building and shipping my own products to directly meet the needs of my community, using AI to move faster while maintaining a high standard of quality.

Skills

Languages	Python, C#, Java, TypeScript, JavaScript, Swift, SQL, Bash
Frontend	React, Vite, Tailwind CSS, Zustand, Electron, PWA
Backend	.NET Core, Spring, Node.js, Vapor, AWS Lambda, API Gateway
Cloud	AWS (EKS, ECS, EC2, S3, SQS, IAM, CloudFormation), Terraform, Docker, Kubernetes
Data	PostgreSQL (Supabase), DynamoDB, MongoDB, SOQL, Apache Kafka
Tooling	GitHub Actions, Datadog, Dynatrace, Claude Code, Notion, LLM APIs

Experience

Independent Software Engineer

Remote · 02/2026 – Present

- Shipped three production apps end-to-end on AWS backends (Lambda, SQS, DynamoDB, ECS), owning product, architecture, infrastructure, and release for each.
- Identified recurring operational toil across tournament and league workflows and built automation to remove it, productizing my own tooling to enable organizers across multiple communities.
- Built a reusable deploy platform (Terraform + GitHub Actions) and a library of Claude Code agents and skills that automate repetitive engineering, shipping full working apps in as little as two days while building directly with non-technical users.

United Airlines — Software Engineer

Chicago, IL · 09/2022 – 02/2026

- Led a newly formed team to remediate 16,000+ vulnerabilities in one year across 3 teams' Java and Python services, training engineers in secure code and managing biweekly releases.
- Architected an AWS Lambda pipeline to process 300K+ Kafka messages per day, integrating legacy on-prem data with new scalable cloud services.
- Owned a legacy on-prem service end-to-end through its migration to AWS EKS, building new integrated cloud-database services and running it in production with Kubernetes and Dynatrace for monitoring and incident resolution.

Airlines Reporting Corp. — Site Reliability Engineer

Remote · 02/2022 – 08/2022

- Identified a recurring pattern in Lambda errors and automated its triage, removing manual handling for more than half of all errors.
- Standardized SRE practices and documentation to streamline cross-team onboarding.

Quativa — Full-Stack Engineer

Remote · 09/2021 – 12/2021

- Built an adaptive iOS front-end and extended a .NET back-end to serve data to a React app.

CDK Global — Software Engineer II

Hoffman Estates, IL · 11/2019 – 05/2021

- Designed a flexible .NET data model from sales-client interviews and architected Apex API endpoints as a single source of truth across 10+ services.

Silverwork Solutions — Software Engineer

Chicago, IL · 07/2019 – 11/2019

- Built a process to run client jobs in parallel, saving thousands a month in bot licenses.
- Wrote a .NET Core library that let internal developers reach common APIs with configurable logging.

Education

University of Illinois Urbana-Champaign — B.S. Computer Science

May 2019

Projects & Community Leadership

FindMyFGC — Fighting Game Event Finder

Node.js · React · Swift/Vapor · Terraform · ECS

- Built a full-stack web app to search live tournaments by preference, integrating the Gemini API to turn natural-language location input into coordinates, place names, and zip codes.
- Deployed a React front-end to S3/CloudFront and a Swift Vapor back-end to ECS, with Terraform and GitHub Actions pipelines and least-privilege VPC networking.
- Locked down the backend by routing traffic through Cloudflare DNS to ACM-validated HTTPS endpoints and isolating services in a private VPC, blocking direct public access.

Adomi-san Bot — Discord × start.gg Event Automation

Python · Lambda · DynamoDB · SQS

- Automated online tournament administration end-to-end: start.gg bracket import, OAuth score reporting from Discord, check-in flows, and automated reminders.
- Dispatched heavy operations to worker Lambdas via SQS for fast responses, and onboarded and mentored a collaborator on the architecture.
- Designed a data model for varied event types, custom user settings, and easy extension to new event formats.

FGC League Sheets Automation

TypeScript · Google Apps Script · Clasp

- Built a Google Sheets extension to automate competitive leagues, grouping and ranking players by win rate, designed directly with non-technical end users.
- Shipped a full working extension in 2 days, planning the design and data model up front and building with AI-assisted tools.

Fighting Game Frame Data Bot

Python · AWS Lambda · DynamoDB · API Gateway · CI/CD

- Built an API on AWS Lambda that serves game frame data from DynamoDB straight into Discord chat.
- Scraped wiki data with Beautiful Soup and shipped it through full prod and dev GitHub Actions pipelines for safe, fast updates.

Midweek Mashers

Fighting Game Tournament Series · Community Organizer

- Built a shared community and event hub across multiple organizers and tournament series, so players follow one place instead of scattering across separate servers.
- Set results-based criteria for beginner and intermediate brackets, giving skill-oriented competition clear, welcoming standards.
- Designed and ran recurring events and custom-format exhibitions, keeping them novel but simple enough to stay easy to join.
